

4.6 Write a program to prompt the user for hours and rate per hour using input to compute gross pay. Pay should be the normal rate for hours up to 40 and time-and-a-half for the hourly rate for all hours worked above 40 hours. Put the logic to do the computation of pay in a function called **compute_pay()** and use the function to do the computation. The function should return a value. Use 45 hours and a rate of 10.50 per hour to test the program (the pay should be 498.75). You should use **input** to read a string and **float()** to convert the string to a number. Do not worry about error checking the user input unless you want to - you can assume the user types numbers properly. Do not name your variable sum or use the sum() function.

Grade updated on server.

```
1 def compute_pay(h, r):
2     if h > 40:
3         overtime = h - 40
4         pay = (40 * r) + (overtime * 1.5 * r)
5     else:
6         pay = h * r
7     return pay
8 hrs = input("Enter Hours:")
9 rate = input("Enter Rate:")
10 h = float(hrs)
11 r = float(rate)
12 p = compute_pay(h, r)
13 print("Pay", p)
```

Your Output

Pay 498.75

Desired Output

Pay 498.75
