

7.2 Write a program that prompts for a file name, then opens that file and reads through the file, looking for lines of the form:

X-DSPAM-Confidence: 0.8475

Count these lines and extract the floating point values from each of the lines and compute the average of those values and produce an output as shown below. Do not use the `sum()` function or a variable named `sum` in your solution.

You can download the sample data at <http://www.py4e.com/code3/mbox-short.txt> when you are testing below enter `mbox-short.txt` as the file name.

Check Code

Grade updated on server.

```
1 # Use the file name mbox-short.txt as the file na
2 count = 0
3 total = 0
4 fname = input("Enter file name: ")
5 fh = open(fname)
6 for line in fh:
7     if not line.startswith("X-DSPAM-Confidence:"):
8         continue
9     value = float(line[20:])
10    count = count + 1
11    total = total + value
12    average = total/count
13 print("Average spam confidence:", average)
```

Your Output

Average spam confidence: 0.7507185185185187

Desired Output

Average spam confidence: 0.7507185185185187
