

8.5 Open the file **mbox-short.txt** and read it line by line. When you find a line that starts with 'From ' like the following line:

```
From stephen.marquard@uct.ac.za Sat Jan 5 09:14:16 2008
```

You will parse the From line using `split()` and print out the second word in the line (i.e. the entire address of the person who sent the message). Then print out a count at the end.

Hint: make sure not to include the lines that start with 'From:'. Also look at the last line of the sample output to see how to print the count.

You can download the sample data at <http://www.py4e.com/code3/mbox-short.txt>

[Check Code](#)[Reset Code](#)

Grade updated on server.

```
1 count = 0
2 fname = input("Enter file name: ")
3 fh = open(fname)
4 for line in fh:
5     if line.startswith("From "):
6         words = line.split()
7         print(words[1])
8         count = count+1
9 print("There were", count, "lines in the file with")
```

Your Output

```
stephen.marquard@uct.ac.za
louis@media.berkeley.edu
zqian@umich.edu
rjlowe@iupui.edu
zqian@umich.edu
rjlowe@iupui.edu
cwen@iupui.edu
cwen@iupui.edu
