

9.4 Write a program to read through the **mbox-short.txt** and figure out who has sent the greatest number of mail messages. The program looks for 'From' lines and takes the second word of those lines as the person who sent the mail. The program creates a Python dictionary that maps the sender's mail address to a count of the number of times they appear in the file. After the dictionary is produced, the program reads through the dictionary using a maximum loop to find the most prolific committer.

Grade updated on server.

```
1 name = input("Enter file:")
2 if len(name) < 1:
3     name = "mbox-short.txt"
4 handle = open(name)
5 counts = dict()
6 for line in handle:
7     if line.startswith("From "):
8         words = line.split()
9         email = words[1]
10        counts[email] = counts.get(email, 0) + 1
11 max_email = None
12 max_count = None
13 for email, count in counts.items():
14     if max_count is None or count > max_count:
15         max_email = email
16         max_count = count
17 print(max_email, max_count)
```
