

10.2 Write a program to read through the `mbox-short.txt` and figure out the distribution by hour of the day for each of the messages. You can pull the hour out from the 'From ' line by finding the time and then splitting the string a second time using a colon.

```
From stephen.marquard@uct.ac.za Sat Jan 5 09:14:16 2008
```

Once you have accumulated the counts for each hour, print out the counts, sorted by hour as shown below.

Check Code**Reset Code**

Grade updated on server.

```
1 name = input("Enter file:")
2 if len(name) < 1:
3     name = "mbox-short.txt"
4 handle = open(name)
5 counts = dict()
6 for line in handle:
7     line = line.rstrip()
8     if not line.startswith("From "):
9         continue
10    words = line.split()
11    time = words[5]
12    hour = time.split(':')[0]
13    counts[hour] = counts.get(hour, 0) + 1
14 for hour, count in sorted(counts.items()):
15     print(hour, count)
```

Your Output

```
04 3
06 1
07 1
09 2
10 3
11 6
14 1
15 2
16 4
17 2
18 1
19 1
```

Desired Output

```
04 3
06 1
07 1
09 2
10 3
11 6
14 1
15 2
16 4
17 2
18 1
19 1
```
